

### ROCK PROTECTION:

The Gopher General is designed with protection against rocks and other obstacles. The disk will ride up and over rocks sticking 4" above ground.

The shank and torpedo will pivot up and back as much as 18" to clear rocks, either buried or rolled out, and automatically re-enter the ground.

The angled packer wheels move independent to the shank to press and seal the shank furrow. All three systems work using a hydraulic accumulator system.

### TRACTOR:

A 50 HP drawbar tractor with an alternator putting out 35 amps and one hydraulic circuit is all that is required. There is no control box or other equipment necessary on the tractor.

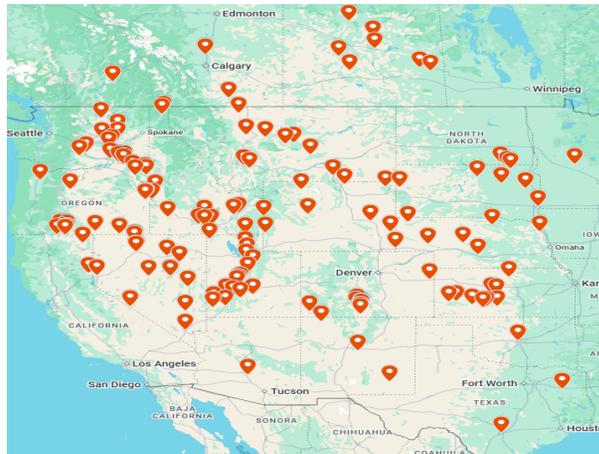

## GOPHER GENERAL BENEFITS

Imagine cutting forage crops without gopher mounds.

- Smooth fields mean fast, trouble-free operations
- Less downtime, less equipment repairs
- Less complete equipment rebuild costs
- No more dirt in the hay or silage
- Better forage stands with longer life
- Best of All—Top Quality Forage Crop Production

# GOPHER GENERAL

# EFFECTIVE FUMIGATION OF POCKET GOPHERS

**1-844-395-1033**

## A SEALED TUNNEL KEEPS THE FUMIGANT IN THE GROUND

A large disk, moving independent to the shank, enters the ground before the shank. It cuts a deep slot in the soil, cutting thru roots so they do not wrap the shank.

The shank and torpedo enter the ground after the disk is at depth. The shank cuts clean, making an artificial tunnel about 12" below the surface. The shank is automatically cleaned as it is raised out of the ground.

High Wear Resistant  
Replaceable Shank  
Edge and Points  
Made in the USA

## FUMIGATION COSTS:

Figure on spending \$10-\$15 / acre if you have to treat the entire field. Very few gophers survive this operation. Following this, spot treatment for escapes and gopher migration will run you \$2-\$5 / acre.

## EFFECTIVE LASTING FUMIGATION

Gopher General meters slow release fumigant tablets into an artificial tunnel. The fumigant gas released is heavier than air, and remains below ground. The gas moves down the tunnel and through the soil. It is not detected by the gophers, and it remains effective for a number of days. There are fumigants readily available that work well on pocket gophers

**ALWAYS READ AND FOLLOW FUMIGANT LABEL DIRECTIONS.**

## SAFE:

There is a moisture proof, lockable storage compartment on the machine for fumigant containers. The fumigant tablets are poured into an enclosed hopper at the start of treating a field. The operator's exposure to the fumigant is limited to the start and end of the day.

## AIR INDUCTION PRODUCT METERING:

The fumigant tablets are metered from the hopper into a venturi air stream. An electric fan provides the air blast which transports the tablets down the back of the shank, and out the rear of the torpedo. Fumigant tablets only meter when torpedo is at full working depth.

There is no open bottom on the torpedo to plug with trash or mud.

## TIMING OF APPLICATION:

The best control of pocket gophers occurs when the female gophers are active. We get the best control from applications in early spring and fall. Some fumigants require a minimum soil temperature, minimum humidity, or minimum soil moisture to be effective.

**ALWAYS READ AND FOLLOW LABEL DIRECTIONS.**
